

ASSIGNMENT-4.3

2303a51595

B-10

TASK-1

Prompt :

Write a Java program that takes an integer from the user and calculates its factorial using a loop. The program should display the final factorial value clearly.

Code :

```
import java.util.Scanner;
public class LeapYearChecker {

    public static boolean isLeapYear(int year) {

        if (year % 4 == 0) {
            if (year % 100 == 0) {
                return year % 400 == 0;
            }
            return true;
        }
        return false;
    }

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        System.out.print("Enter a year: ");
        int year = scanner.nextInt();

        if (isLeapYear(year)) {
            System.out.println(year + " is a leap year.");
        } else {
            System.out.println(year + " is not a leap year.");
        }
    }
}
```

```
scanner.close();
```

Output :

The screenshot shows a Java development environment with the following details:

- File Menu:** File, Edit, Selection, View, ...
- Toolbar:** Back, Forward, Home, Refresh, Stop.
- Search Bar:** Q Comptative Programming
- Explorer:** COMPATITIVE PROGRAMMING folder containing J ast.class, J ast.java, J Item.java, J LeapYearChecker.class, J LeapYearChecker.java, J Main.java, J MainItem.class, and J MainJob.class.
- Code Editor:** The current file is J LeapYearChecker.java, which contains the following code:

```
1 // Generate a Java method that accepts a year as input, checks whether it is a leap year using correct logic,using user input
2 // returns an appropriate result, and provides a sample input and output.
3 import java.util.Scanner;
4 public class LeapYearChecker {
5
6     public static boolean isLeapYear(int year) {
7
8         if (year % 4 == 0) {
9             if (year % 100 == 0) {
10                 return year % 400 == 0;
11             }
12             return true;
13         }
14         return false;
15     }
16
17     public static void main(String[] args) {
18         Scanner scanner = new Scanner(System.in);
19         System.out.print("Enter a year: ");
20         int year = scanner.nextInt();
21
22         if (isLeapYear(year)) {
23             System.out.println(year + " is a leap year.");
24         } else {
25             System.out.println(year + " is not a leap year.");
26         }
27     }
28 }
```

- Bottom Navigation:** PROBLEMS, OUTPUT, DEBUG CONSOLE, PORTS, TERMINAL, GITLENS.
- Terminal:** cmd
- Log Output:**

```
C:\Users\deep\Downloads\OneDrive\Desktop\Comptative Programming>java LeapYearChecker
2020 is a leap year.

C:\Users\deep\Downloads\OneDrive\Desktop\Comptative Programming>java LeapYearChecker.java

C:\Users\deep\Downloads\OneDrive\Desktop\Comptative Programming>java java LeapYearChecker
Error: Could not find or load main class java
Caused by: java.lang.ClassNotFoundException: java

C:\Users\deep\Downloads\OneDrive\Desktop\Comptative Programming>java LeapYearChecker.java

C:\Users\deep\Downloads\OneDrive\Desktop\Comptative Programming>java leapYearChecker
Enter a year: 2025
2025 is a leap year.
```
- Bottom Status Bar:** OUTLINE, TIMELINE, master, Launchpad, 0:0, Java, Show desktop.

Analysis :

In this task, leap year conditions are checked using standard rules. The program correctly identifies a leap year based on divisibility by 4, 100, and 400.

TASK-2

Prompt :

Write a Java program to convert centimeters to inches using user input.

Example: If the input is 10 cm, the output should be 3.94 inches. Use the correct conversion formula and display the result properly.

Code :

```
import java.util.Scanner;
```

```

public class CentimeterConverter {

    // Method to convert centimeters to inches
    public static double centimetersToInches(double centimeters) {
        return centimeters / 2.54;
    }
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        System.out.print("Enter value in centimeters: ");
        double centimeters = sc.nextDouble(); // user input

        double inches = centimetersToInches(centimeters);

        System.out.println(centimeters + " centimeters is equal to " + inches + " inches.");

        sc.close();
    }
}

```

Output :

```

File Edit Selection View Go Run ... ← → Q CentimeterConverter.java - AI ASSISTED CODE - Visual Studio Code - Untracked
EXPLORER state.java primeNum.java M EnergyBillCalculator.java U CentimeterConverter.java U recursive ...
CENTIMETERCONVERTER.JAVA
1 import java.util.Scanner;
2
3 public class CentimeterConverter {
4
5     // Method to convert centimeters to inches
6     public static double centimetersToInches(double centimeters) {
7         return centimeters / 2.54;
8     }
9
10    public static void main(String[] args) {
11        Scanner sc = new Scanner(System.in);
12
13        System.out.print("Enter value in centimeters: ");
14        double centimeters = sc.nextDouble(); // user input
15
16        double inches = centimetersToInches(centimeters);
17
18        System.out.println(centimeters + " centimeters is equal to " + inches + " inches.");
19
20        sc.close();
21    }
22}

```

C:\Users\deeps\Downloads\OneDrive\Desktop\AI ASSISTED CODE>javac CentimeterConverter.java
C:\Users\deeps\Downloads\OneDrive\Desktop\AI ASSISTED CODE>java CentimeterConverter
Enter value in centimeters: 13
13.0 centimeters is equal to 5.118110236220472 inches.

Analysis :

The program converts centimeters to inches using the correct mathematical formula. The output values are accurate for different inputs.

TASK-3

Prompt :

Write a Java program that accepts a full name from the user and formats it as “Last, First”.

Code :

```
import java.util.Scanner;
public class NameFormatter {

    // Method to format the name as "Last, First"
    public static String formatName(String fullName) {
        String[] nameParts = fullName.split(" ");
        if (nameParts.length != 2) {
            return "Invalid input. Please enter a full name with first and last
name.";
        }
        String firstName = nameParts[0];
        String lastName = nameParts[1];
        return lastName + ", " + firstName;
    }

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        System.out.print("Enter your full name (First Last): ");
        String fullName = sc.nextLine(); // user input

        String formattedName = formatName(fullName);
```

```

        System.out.println("Formatted Name: " + formattedName);

        sc.close();
    }
}

```

Output :

```

Screen Reader Optimized Ln 12, Col 40 Spaces: 4 UFT-8 CRLF {} Java (8) Go Live

Analysis :

In this task, multiple examples are used to understand the required output format. The program takes a full name as input, separates the first name and last name, and rearranges them into “Last, First” format. By following the given examples, the output is consistent and correctly formatted for all valid inputs.

TASK-4

Prompt :

Write a Java program that takes a string as input and counts the number of vowels present in it.

CODE :

```
--import java.util.Scanner;
public class VowelCounterZeroShot {

    // Method to count vowels in a string
    public static int countVowels(String input) {
        int count = 0;
        String vowels = "aeiouAEIOU";
        for (char c : input.toCharArray()) {
            if (vowels.indexOf(c) != -1) {
                count++;
            }
        }
        return count;
    }

    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        System.out.print("Enter a string: ");
        String input = sc.nextLine(); // user input

        int vowelCount = countVowels(input);

        System.out.println("Number of vowels: " + vowelCount);

        sc.close();
    }
}
```

Output :

The screenshot shows a Visual Studio Code interface with the following details:

- File Explorer:** Shows various Java files in the "AI ASSISTED CODE" folder.
- Code Editor:** Displays the `VowelCounterZeroShot.java` file. The code counts vowels in a string using a scanner. It includes imports, a class definition, a static method for counting vowels, and a main method that reads input from the console and prints the result.
- Terminal:** Shows the command `javac VowelCounterZeroShot.java` being run, followed by the output of the program running with the input "uday".
- Status Bar:** Shows the current file is `VowelCounterZeroShot.java`, the line count is 27, and other status information like screen reader optimization and encoding.

Analysis :

The vowel-counting program written using examples shows clearer logic and is easier to read. Providing examples helps in understanding the expected behavior and improves the overall quality of the code.

TASK-5

Prompt :

Write a Java program that reads a .txt file and counts the total number of lines in it.

Example:

If the file contains 3 lines, the output should be 3.

The program should take the file path as input and display the line count.

Code :

```
import java.io.BufferedReader;
import java.io.FileReader;
import java.io.IOException;
import java.util.Scanner;
```

```
public class FileLineCount {  
  
    // Method to count number of lines in a file  
    public static int countLines(String filePath) throws IOException  
    {  
        BufferedReader br = new BufferedReader(new  
        FileReader(filePath));  
        int lineCount = 0;  
  
        while (br.readLine() != null) {  
            lineCount++;  
        }  
  
        br.close();  
        return lineCount;  
    }  
  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
  
        System.out.print("Enter the file path: ");  
        String filePath = sc.nextLine();  
  
        try {  
            int lines = countLines(filePath);  
            System.out.println("Number of lines in the file: " + lines);  
        } catch (IOException e) {  
            System.out.println("Error reading the file.");  
        }  
    }  
}
```

```
    sc.close();  
}  
}
```

Output :

Analysis :

This program works by taking the file path from the user, reading the file line by line, and increasing a counter for each line, which finally gives the total number of lines in the file while handling errors safely.
